EDUCATION

Thakur College of Engineering & Technology (TCET), Mumbai, India *Oct 2024 – May 2027*
Bachelor of Computer Applications (BCA) *8.18 CGPA*

TECHNICAL SKILLS

Languages: Python, JavaScript, C#, .NET, SQL, CSS, HTML
Developer Tools: Git & GitHub, Vercel, npm, Selenium, Vite
Concepts: REST APIs, Microservices, OOP's, SDLC, DBMS, CI/CD
AI Development Tools: OpenAI Codex, Claude Code, Antigravity
Exposure: Node.js, React.js, MongoDB, Tailwind CSS, Bootstrap
IDE: Visual Studio, Eclipse

EXPERIENCE

Research Head, Zephyr 2025 | TCET, Mumbai *Aug 2025 – Oct 2025*

Owned research and content management lifecycle for 20+ events in TCET's annual technical fest; defined data collection standards adopted across 5 coordinating teams.

Designed and maintained structured JSON schemas for event listings including title, pricing, registration metadata, and media fields integrated directly into the fest's production website.

PROJECTS

YoutubeUnsubscriber | Live Preview **(***August 2026 – September 2026***)**

Built a dependency-free JavaScript automation tool that runs directly in the browser console to bulk-unsubscribe from YouTube channels, removing the need to click through each subscription manually.

Automated the end-to-end DOM interaction flow detecting loaded subscription buttons, opening each channel's menu, selecting "Unsubscribe," and confirming the action to process multiple channels in a single run.

Published as an open-source utility (GPL-3.0) requiring no installation or external dependencies, usable directly via browser Developer Tools.

Username Availability | Live Preview **(***June 2026 – July 2026***)**

Built a full-stack username availability and registration service using Node.js, Express, MongoDB, Mongoose, and Vercel serverless functions.

Implemented live availability checks, normalized usernames, validation, and conflict-safe registration with HTTP 409 handling for duplicate usernames.

Deployed the frontend and API on Vercel with MongoDB Atlas for persistent cloud data storage.

Weather App | Live Preview **(***March 2025 – April 2025***)**

Built a weather forecasting web app that fetches real-time weather data via the OpenWeatherMap API based on user-entered city search.

Designed a clean, responsive UI to display current temperature and weather conditions with minimal load time.

Handled API integration and error states (invalid city, failed requests) for a smooth user experience.
